Work

Work

Input various words ~> sort based on syllables or letters

Sorted words ~> structured poem

Input poem type ~> change format accordingly

Use string inputs, count number of letters in each string input, sort into a poem.

Code

```

import java.util.Arrays;

public class SimplePoem {
    public static void main(String[] args) {
        String[] words = {"beautiful", "sky", "the", "shines", "brightly", "above", "star"};

        String poemType = "COUPLET";

        for (int i = 0; i < words.length; i++) {
            for (int j = i + 1; j < words.length; j++) {
                if (words[i].length() > words[j].length()) {
                    String temp = words[i];
                    words[i] = words[j];
                    words[j] = temp;
                }
            }
        }

        System.out.println("--- Poem Type: " + poemType + " ---");

        if (poemType.equals("COUPLET")) {
            for (int i = 0; i < words.length; i++) {
                System.out.print(words[i] + " ");
                if (i % 2 != 0) {
                    System.out.println();
                }
            }
        }
        else {
            for (String word : words) {
                System.out.println(word);
            }
        }
    }
}

```
